

Cornucopia

Requirements Document

Source: Partner / product planning notes, 2026-08-16

Status: Draft for review - not yet scheduled or estimated

Scope: Admin Portal, Mobile App (iOS/Android), Firebase backend

Epic 1 - Partner Mailing List Upload

Let partners bring their own contact list into Cornucopia, with consent handling and a usage gate.

- R-1.1** Partners can upload their own mailing list (contact file) from the partner-facing side of the portal.
- R-1.2** On upload, each contact is sent a welcome email with an explicit Opt In / Decline choice before receiving any further marketing (spam protocol / consent gate).
- R-1.3** Contacts who do not opt in are not marketed to; their status is tracked as pending/declined vs. confirmed.
- R-1.4** Uploads are capped at 1,000 contacts for free; uploading more requires payment.

Open questions:

- What payment mechanism/pricing applies above 1,000 contacts?
- Where does opt-in status live, and is it visible to the partner?
- Is there a shared suppression/unsubscribe list, or is it per-partner?

Epic 2 - Admin Portal: "Manage Uploads" Restructure

Consolidate the admin's upload-review workflow into one screen, simplify the left nav, and surface actions where admins are already looking.

- R-2.1** Create a new admin screen, "Manage Uploads," that keeps the current visual/state layout of "My Uploads" but adds the functionality currently in "Manage Uploads" (Business / File / Target / Status / Date / Actions table with Approve, Reject, Push to App).
- R-2.2** The admin left nav is reduced to three menu options total.
- R-2.3** The Pending tab appears before the Approved tab in the admin portal.
- R-2.4** Clicking a "new partner upload" notification takes the admin directly to the Pending tab, not a generic landing page.
- R-2.5** Approve / Reject / Push to App action buttons are also available directly inside the product/model detail page, positioned below the product thumbnail image.

Open questions:

- What are the exact three left-nav items after this change?
- Do in-detail-page action buttons disappear once a model is approved/pushed, or stay visible with disabled/alternate states?

Epic 3 - Admin Portal: "Manage Partner" Nav Item

Give partner-subscription management its own top-level place in the nav instead of being buried.

- R-3.1** Add a standalone left-nav item, "Manage Partner," that hosts the existing Partner Subscriptions screen (partner selector dropdown, subscriber checkbox list, "Refresh Partners/Users" and "Save Subscriber Mapping" actions).

Epic 4 - Admin Portal: Category Management

Give admins control over product categories, with a hard rule tying category visibility to whether it actually has content.

- R-4.1** Build an admin-side system for creating/editing/managing product categories.
- R-4.2** A category with 0 models in it must not appear on the mobile app front end.

Epic 5 - Share Tracking (Data Capture)

Every share action becomes durable, queryable data - this feeds the Partner Report (Epic 14) and per-product report (Epic 11).

R-5.1 Every time a user shares a product, record that interaction (who, what product, when).

R-5.2 Persist, in Firebase, a list of all entities/destinations a user has shared a product with.

Open questions:

- Can we capture the destination for every share channel? Native OS share sheets often only report "share sheet opened," not which app the user picked - R-5.2 may need to be scoped down to "share initiated" + channel-if-available.

Epic 6 - Mobile App: Screen Chrome Consistency

R-6.1 The Question screen has a title bar (consistent with other screens in the app).

R-6.2 The Rating screen has a title bar.

Epic 7 - Firebase Data Model: Question -> Answer Mapping

Replace the current loosely-structured 'answers' node with an explicit per-question mapping.

R-7.1 Replace/supplement the current "answers" field with a "question_answers" field structured so each question ID is explicitly mapped to the answer given for that specific question.

R-7.2 Existing fields such as "comment", "opened", "saved", "Rating" continue to be tracked alongside the new mapping.

Open questions:

- Is this a migration of existing data, or does question_answers only apply going forward? If existing data must migrate, a one-time backfill script is needed.

Epic 8 - Partner Analytics Dashboard Linkage

R-8.1 User interactions with a partner's models (opens, saves, ratings, question answers, shares) roll up and are visible on that partner's own analytics dashboard - not only in the global admin view.

Epic 9 - Partner Pricing, Deals & Call-to-Action

Let partners monetize and drive action directly from the product card/screen.

R-9.1 Partners can configure pricing on their product: Brand Value and Price fields (e.g., "Brand Value \$1,200" / "Price \$900.00").

R-9.2 Partners can configure a deal type via radio buttons: e.g., Discount, BOGO (Buy One Get One).

R-9.3 The mobile app renders a template on the product screen that reflects the configured deal type and

pricing.

R-9.4 Partners can configure a call-to-action (CTA) button per product, choosing one of: Buy Now, Subscribe, Donate, Pre-Order, Join Waitlist - each with a partner-supplied link.

R-9.5 Partners may instead choose No CTA, in which case the product screen shows only Save and Share, and the layout reflows to fill the space the CTA button would have occupied.

Open questions:

- Can a product have both a deal (R-9.2) and a CTA (R-9.4) simultaneously, or are they mutually exclusive layouts?
- Do we restrict CTA links to <https://> / known domains, or accept any URL as-is?

Epic 10 - Mobile App: Engagement Stats Surfaced to Users

- R-10.1** Total view count and/or save count can be displayed to the end user on the product card, alongside existing info like the star rating.

Epic 11 - Reporting: Per-Product Interaction Report

A dedicated report page per product with full statistical detail on how users engage with it.

- R-11.1** Rating statistics: Median, Average, Standard Deviation, Min, Max, Frequency Distribution, and any other statistically relevant rating metrics.
- R-11.2** Full list of question/answer responses, plus the distribution of answers per question.
- R-11.3** For multiple-choice questions specifically: a horizontal bar graph of answer distribution.
- R-11.4** The bar graph supports two view modes: percentage and raw values (e.g., number of clicks) - user-toggable.
- R-11.5** Time spent interacting with the product is reported (see Epic 12 for underlying capture).
- R-11.6** Views-over-time graph, broken down by day and time.
- R-11.7** CTA click counts are included in the report and shown on a timeline, in the same style as the views-over-time graph.

Epic 12 - Engagement Timing (Dwell Time)

- R-12.1** Track how long a user keeps the Product Detail page open (a per-view session/dwell timer), feeding into R-11.5.

Epic 13 - Notifications: Countdown Urgency Timer

- R-13.1** Replace the current "Recently Added" label/sort on notifications with a live countdown timer starting at 24 hours, ticking down to create urgency.

Epic 14 - Partner Report: Sharing Metrics

A new report component built on the share-tracking data from Epic 5, designed to surface and reward partners' best growth-driving users.

- R-14.1** Report the cumulative number of times users have shared a partner's product(s).
- R-14.2** Show the distribution of shares over time, in the same timeline-chart style used for other engagement metrics.
- R-14.3** Build a share histogram: X axis = binned ranges of total shares per user (0, 1-10, 11-20, 21-30, ...); Y axis = number of users falling into each bin.
- R-14.4** In the admin backend, clicking a histogram bin surfaces the list of users in that bin, so the team can identify and promote/reward high-sharing users.

Epic 15 - Strategic Concept: "Cornucopia Store" (not a build item yet)

Idea: treat Cornucopia itself as a store alongside partner stores, applying the same success metrics/reporting being built for partners (Epics 8, 11, 14) as a baseline for Cornucopia's own product promotion - analogous to "Amazon plus its third-party sellers."

Framed explicitly as starting to measure a baseline now, using infrastructure already being built, rather than a new standalone project. Positioned as (a) a new marketing/sales channel leaning on "Gift Economy" dynamics, and (b) a low-cost way to gauge product demand before further physical/product development.

Action for now: no build task - revisit once Epics 8/11/14 reporting exists, since it is meant to reuse that data.

Summary of Open Questions

1. Mailing-list overage pricing/payment flow (Epic 1).
2. Opt-in/suppression list scope - per-partner or shared (Epic 1).
3. Final 3-item admin left-nav naming/composition (Epic 2).
4. Behavior of in-page action buttons after approval (Epic 2).
5. Share destination capture limits imposed by native OS share sheets (Epic 5).
6. Migration plan for existing 'answers' data into 'question_answers' (Epic 7).
7. Can a product show both a deal and a CTA at once (Epic 9)?
8. CTA link validation rules (Epic 9).
